· Application/Control Number: 10/038,125

Art Unit: 2653

1. Applicant's election without traverse of Group I, claims 1-14 in Paper No. 8 is acknowledged.

- 2. Claims 1, 12, 13 are objected to because of the following informalities: in claim 1, line 1, --a-- should be inserted before "magnetic"; in claim 1, line 1, --a-- should be inserted before "NiMn"; in claim 12, line 1, --the-- should be inserted before "at"; in claim 12, line 2, "a NiMn" should be changed to --the NiMn--; in claim 13, line 1, --the-- should be inserted before "at". Appropriate correction is required.
- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1, 3-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over JP 10-256621 in view of Journal of Applied Physics article "Oxygen as a surfactant in the Growth of Giant Magnetoresistive Spin Valves" to Egelhoff et al (hereinafter "Egelhoff"). JP '621 shows a method for providing precise control of magnetic coupling field in NiMn top spin valve head (see col. 2, line 37 for permissible antiferromagnetic materials, specifically "NiMn"), comprising: forming at least one copper layer (3 or 5) in a NiMn top spin valve, and depositing remaining layers (free layer 4, pined layer 6, and antiferromagnetic layer 7) of the NiMn top spin valve head. However, JP'621 does not show the copper seed 3 and the copper spacer layer 5 being partly oxidized with oxygen. Egelhoff disclosed a spin valve head that oxidizes the copper spacer layer to greatly enhance the magnetoresisitive effect (see pages 6144-6147). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to

· Application/Control Number: 10/038,125

Art Unit: 2653

oxidize the copper layers in the spin valve of JP'621 as taught by Egelhoff as doing this would enhance the GMR effect over that of a non-oxidized spin valve head, and would increase the beneficial specular reflection of electrons by creating a smoother or more well ordered growth pattern of the layers as taught by Egelhoff. It is noted that with regard to the dependent claims 3, 4, 6, 7, 12, and 13, the various gains in the spin valve performance (e.g. claim 3-- reduces the ferromagnetic coupling field without deteriorating GMR effect or resistance; claim 4-- provides a negative coupling field without affecting GMR effect or resistance;; claim 7-- provides stronger growth of NiFe(111) and NiMn(111) with respect to NiFe(200) and NiMn(002) phases; claim 12--provides an approximately 15% increase in amplitude of the output of a NiMn spin valve head at the same coupling field; claim 13-- does not affect asymmetry performance) would all be inherent in oxidizing the copper layers in the JP'621 reference as the structure is the same as Applicant's NiMn top spin valve.

- 5. Claim 2 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
- 6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. JP 9-275233 shows a NiMn top spin valve head while Carey et al and EP 1124273 both show the use of CuO in spin valve heads.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to David L. Ometz whose telephone number is (703) 308-1296. The examiner can normally be reached on M-F, 6:00-3:00.

· Application/Control Number: 10/038,125

Art Unit: 2653

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, William Korzuch can be reached on (703) 305-6137. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 305-4750.
